## Preface

Understanding disease is a challenging and complex process and different from diagnosing pathogen involvement. Sophisticated molecular techniques are becoming available for a range of infectious diseases and represent valuable tools; however, for disease diagnosis they generally focus on confirming or ruling out the presence of an aetiological agent. The fish itself is a complicated biological system, and the disease process the result of interactions between the agent, the host and the environment. An understanding of the normal structure and function is important so that deviations from normality that occur during disease are recognised. A good pathologist should therefore possess knowledge in diverse disciplines such as biology, genetics and physiology, parasitology, microbiology and immunology, to mention a few.

Within aquaculture, fish farming has experienced a tremendous growth and is still developing rapidly with salmonid production being a relevant component of this expansion, if not in terms of tonnage, certainly in terms of its economic value. As with all intensification in animal production, new diseases and diverse problems arise and represent diagnostic challenges, economic losses and, importantly, animal welfare issues. In this scenario and in spite of all the new techniques available, morphological pathology will remain the gold standard and cannot be replaced in the initial stages of diagnostic work. In addition, fish are increasingly being used as experimental animals, and therefore knowledge of basic fish pathology remains important for scientists.

It is our hope and intention that this book will increase the awareness and significance of diseases and animal welfare of this iconic group of fish—the salmonids. We anticipate that fish farmers, fish veterinarians and practitioners, hobbyists, anglers, policy makers and regulators will find this book useful, and even for those not working with disease as their primary focus, we believe that by understanding the pathological processes this can make their job more rewarding. For the authors, fish pathology has been a life-long experience and passion, something we hope a new generation of professionals will give continuity. The pathogen diversity and new manifestations of disease makes it a very dynamic discipline and an all-embracing art where there will always be something new to learn.

*'Make an early start in your career to become a good pathologist'*

## Acknowledgements

The authors would like to thank the Marine Scotland Science and the Norwegian School of Veterinary Science for their support. In addition we are grateful to Tor Atle Mo who advised on the recent taxonomic changes within the Protist and Metazoa and to Graham Bruno who has tirelessly dealt with our IT enquiries. We also appreciate the help of Mark Fordyce and Nichola McManus from Marine Scotland for cutting and staining additional material. We are also grateful to many colleagues who have generously donated images or wax blocks from which sections were prepared for this book, and these are acknowledged below.
